

PROTECT YOUR DATA!

PROTECT YOUR PRIVACY!

With Mobile Lifeline installed... you can again have the peace-of-mind that your data is safe. Mobile Lifeline is a low cost monitoring and security service designed for laptop computers and other portable devices. Its unique Remote Data Protection (RDP) technology uses a small, flexible agent that can reside on virtually any mobile data device. Creating a powerful Internet-based communication link with its host, the agent is able to perform a wide variety of functions, silently and without interrupting normal computing operations.

Mobile Lifeline's features include:

File Encryption Mobile Lifeline users have the ability to choose specific files (either individually or by document type) that will be encrypted, if your laptop is reported lost or stolen. Preselected files are automatically encrypted the next time the computer is connected to the Internet and are completely unreadable. If you recover your computer, Mobile Lifeline will automatically decrypt all encrypted files.

File Retrieval A security option that allows the authorized Mobile Lifeline user to identify key files or file types (such as e-mail documents, key spreadsheets or important Microsoft Word documents) that will be retrieved if the laptop is reported lost or stolen.

File Wiping Another security feature Mobile Lifeline users can employ to protect their sensitive information. Critical files or file types can be preselected and, at the instruction of the authorized user will be thoroughly deleted with no trace.

Screen Blocking Mobile Lifeline users can also select a screen blocking feature that will effectively "lock up" their laptop **regardless of an internet connection**. The user is required to enter a password before normal operation will be restored. The screen blocking feature can be activated either on command at the computer's next check-in or based upon a predetermined period of inactivity.
